用中文介紹日本京都旅遊

User

當然！京都日本最具代表性的古都，擁有無數的歷史古蹟、寺廟、神社、花園、街區等觀光資源，以下是我為你準備的日本京都旅遊介紹：

- 1.歷史古蹟：京都日本歷史的中心，擁有眾多的歷史古蹟，包括皇宮、寺廟、神社、城堡等。其中最著名的是金閣寺、二條城、伏見城、京都御所等。
- 2.寺廟：京都日本佛教的發源地，擁有眾多寺廟，包括京都最大的寺廟——京都寺、京都最古老的寺廟——仁和寺、日本最美的寺廟——龍口寺、以美麗庭園聞名的——伏見稻荷大社等。
- 3.神社：京都有眾多神社，包括祭祀日本最高神——天照大神——的——神宮寺、祭祀日本武尊——大國主——的——大國神社、祭祀學問之神——學問神社、祭祀商業之神——商神社等。
- 4.花園：京都有眾多美麗的花園，包括有「京都之花」之稱的——京都公園、以「小京都」聞名的——伏見桃山、以「春櫻」聞名的——京都府立植物園等。
- 5.街區：京都市內有眾多的傳統街區，包括有「京都最美街區」之稱的——四條河原町、有「京都的小歐洲」之稱的——清水寺通、有「京都最古老街區」之稱的——宇治、有「京都最美麗街區」之稱的——嵐山等。
- 6.節日：京都有眾多傳統節日，包括新年的第一次參拜——「京都新年參拜」、春季的「京都櫻花節」、秋季的「京都紅葉節」、冬季的「京都冬季點燈」等。
- 7.美食：京都日本傳統美食的代表地，包括「京料理」、「和菓子」、「茶屋」等。
- 8.伴手禮：京都有眾多傳統伴手禮，包括「京都和菓子」、「京都茶菓子」、「京都菓子」等。

以上是京都的八大旅遊景點，希望對你有幫助！若你有任何其他問題，請隨時問我。

Inference Engine by NVIDIA TensorRT-LLM
Number of words: 666
Number of Tokens: 549
Times: 10.86 sec.
GPUs: NVIDIA RTX A6000

Performance benchmarking of the both
inference engines

Benchmarks of inferencing Traditional Chinese LLM model on NVIDIA GPUs

- We replace the transformers inference APIs by using TensorRT-LLM APIs
- The benchmarks run on NVIDIA GPUs, including V100/A100/A6000/H100
 - ▶ LLM Model: TAIDE Model based on LLaMA2-7B with the version number, b11.
 - ▶ Batch size = 1
 - ▶ Tensor Parallel = 1 and Pipeline Parallel = 1

Inference APIs	Tokens/sec.			Computing time			Words/sec.		
TAIDE 7B (b11) with FP16	V100	A100	A6000	V100	A100	A6000	V100	A100	A6000
Hugging Face	10.63	5.38	10.88	26.13	29.53	29.01	35.45	40.05	39.35
NVIDIA TRT-LLM	19.44	17.21	17.51	52.30	103.35	51.10	63.59	125.65	62.13
Speedup	1.83	3.20	1.61	2.001	3.500	1.761	1.794	3.138	1.579
Speedup, compared to V100	1.829	3.613	1.787	2.001	3.954	1.955	1.794	3.545	1.753

Discover the Gion Kobu, a traditional Japanese district known for its beautiful

Visit the Kyoto Imperial Palace, a former residence of the Emperor of Japan a

Don't forget to try some delicious Kyoto-style tofu and other local specialties destinations. 🔍

And of course, no trip to Kyoto is complete without a visit to the Funaoka Roll
paste. 🍣

Come, let me be your helpful assistant, and I'll be happy to guide you through
Inference Engine by NVIDIA TensorRT-LLM

Number of words: 1286

Number of Tokens: 443

Times: 2.55 sec.

GPUs: NVIDIA A100 80GB PCIe

Problems and Solutions

● Modify {TensorRT-LLM}/docker/common/install_base.sh

► OS: ubuntu 22.04

```
init_ubuntu() {
    apt-get update
    apt-get install -y --no-install-recommends wget gdb git-lfs python3-pip python3-dev python-is-python3 libffi-dev
    apt-get install -y --no-install-recommends screen gpustat nvidia-cuda-toolkit curl iftop
    if ! command -v mpirun &> /dev/null; then
        DEBIAN_FRONTEND=noninteractive apt-get install -y --no-install-recommends openmpi-bin libopenmpi-dev
    fi
    apt-get clean
    rm -rf /var/lib/apt/lists/*
    # Remove previous TRT installation
    if [[ $(apt list --installed | grep libnvinfer) ]]; then
        apt-get remove --purge -y libnvinfer*
    fi
    if [[ $(apt list --installed | grep tensorrt) ]]; then
        apt-get remove --purge -y tensorrt*
    fi
    pip uninstall -y tensorrt
    pip install flask flask_sse datasets nltk rouge_score
}
```

Problems and Solutions

● Generation cannot properly stops at EOS (</s>) and only stops at max output length

► Solution: `output_text.replace("</s>", "")`

► Another solution and reference:
